

CDU Printing Agent Test Instructions

Purpose

These steps show how to demonstrate automatic printing without physical printers. Odoo queues the print jobs, the Print Agent pulls them, dry-run mode writes files locally, and Odoo marks the jobs as Done.

1. Upgrade the Odoo module

Upgrade the CDU eLMIS Integration module so the new print queue models, print templates, and menus are loaded.

2. Confirm a dispense

In Odoo, open the dispensing workflow and click Confirm Dispensing. You should see a message similar to: 3 print jobs were queued.

3. Check the queue in Odoo

Go to Configuration > Print Jobs, or open the confirmed dispense record and check the Print Jobs tab. Expected pending jobs include: dispensing_slip to document_printer as PDF, medicine_label to product_printer as TSPL, and bag_label to bagging_printer as ZPL.

4. Prepare the Print Agent config

Open a terminal and run:

```
cd /home/dinny/Documents/CDU/bahmni-docker/bahmni-standard/print-agent  
cp config.example.ini config.local.ini
```

Edit config.local.ini and set:

```
[odoo]  
url = http://localhost:8071  
db = odoo  
username = cdu.admin  
password = eLMIS@1234
```

5. Run the agent once

From the print-agent folder, run:

```
PYTHONPATH=. python3 -m bahmni_print_agent --config config.local.ini --once
```

6. Check generated files

In dry-run mode, the agent does not print to real printers. It writes files to:
/home/dinny/Documents/CDU/bahmni-docker/bahmni-standard/print-agent/printed-output/

You should see PDF, TSPL, or ZPL payload files.

7. Refresh Odoo Print Jobs

Refresh Configuration > Print Jobs. The processed jobs should move from Pending to Done.

Continuous mode

To keep the agent polling continuously, run:

```
PYTHONPATH=. python3 -m bahmni_print_agent --config config.local.ini
```

Real printer setup later

When Windows PCs and printers are available, change `dry_run = false` and configure `product_printer`, `bagging_printer`, and `document_printer` with the real printer IPs or print commands.
